

ZDHC Manufacturing Restricted Substances List

Version 3.0

1 Background

The ZDHC Manufacturing Restricted Substances List (ZDHC MRSL) is a list of chemical substances banned from intentional use in the processing of textile materials, leather, rubber, foam, adhesives and trims used in textiles, apparel, and footwear industry. Intentional use means the substance used deliberately in a chemical product to achieve a desired look or functionality.

The ZDHC MRSL goes beyond the traditional approaches to chemical restrictions, which only apply to finished products (Restricted Substances List - RSL) and is focused on consumer safety. The MRSL approach also helps protect workers, local communities, and the environment from the possible impacts of harmful chemicals.

Chemical formulations covered by restrictions in the ZDHC MRSL include, but are not limited to, cleaners, adhesives, paints, inks, detergents, dyes, colourants, auxiliaries, coatings and finishing agents used during raw material production, wet processing, process machinery maintenance, wastewater treatment, sanitation, and pest control. ZDHC MRSL limits apply to substances in commercially available formulations, not those from earlier stages of chemical synthesis.

Using chemical formulations that conform to the ZDHC MRSL allows suppliers to assure themselves, and their customers, that banned chemical substances are not intentionally used during production and manufacturing processes.

The ZDHC Roadmap to Zero Programme would like to acknowledge the vital role of the experts comprising the MRSL Council who independently and objectively evaluated the proposed additions/ revisions to the ZDHC MRSL V3.0 and made decisions.

2 Purpose

The ZDHC MRSL offers brands and suppliers a single, harmonised list of chemical substances banned from intentional use during manufacturing and related processes in supply chains of the textile, apparel, and footwear (including leather, rubber and foam) industries (the Industry).

Version 3.0 applies to textiles, leather, rubber, foam and adhesives. Recognising that these materials use different processes, search filters can be used to search the limits for each material.

The ZDHC MRSL does not replace legal or brand-specific restrictions on harmful substances in materials or finished products.

3 NOTES

The ZDHC MRSL 3.0 published by ZDHC Foundation does not guarantee the following:

Compliance with, or to take the place of, legal or regulatory requirements. Examples might include: stricter legal, local or regional regulatory requirements on the use, storage and transport of chemical products; or other requirements relating to the handling and disposal of chemical products, which shall supersede any requirements as set forth in this document.

Compliance with, or conformance to, any national or international environmental or workplace safety requirements, including, but not limited to, relevant regulations and/or standards.

Nor do the ZDHC MRSL 3.0 replace any national or international environmental or workplace safety requirements including, but not limited to, regulations and/ or standards.

The ZDHC MRSL 3.0 is not intended nor can be used as a statement of legal requirements.

ZDHC refers to the UN GHS (Globally Harmonized System of Classification and Labelling of Chemicals) as the internationally recognised standard for hazardous material classification and labelling. All the other National/Regional existing schemes, derived from the implementation of the GHS, have to be considered included in the list of the accepted ZDHC standards for this purpose. To simplify the ZDHC MRSL 3.0 comprehension, ZDHC uses GHS throughout as its reference for Hazard Statements and Pictograms in SDS and labels in order to avoid local variables.

4 DISCLAIMERS

ZDHC has made every reasonable effort to make sure that the content and information contained in the ZDHC MRSL 3.0 is as accurate and correct as possible at the time of publication. ZDHC makes no claims, promises, or guarantees about the accuracy, completeness, or adequacy of the contents of this document.

In no event will ZDHC (and/or any related ZDHC majority owned legal entities) or the Directors or staff thereof be liable and ZDHC expressly disclaims any liability of any kind to any party for any loss, damage, or disruption caused:

By errors or omissions, whether such errors or omissions result from negligence, accident, or any other cause and/or;

From any use, decision made or action taken or any other kind of reliance on the ZDHC MRSL 3.0 by a reader or user of it and/or;

For any results obtained or not obtained from the use of the ZDHC MRSL 3.0.

For the avoidance of doubt this Disclaimer applies to all related documents produced by ZDHC, specifically: ZDHC Wastewater Guidelines, ZDHC Sludge Reference Document, ZDHC Wastewater and Sludge Laboratory Sampling and Analysis Plan and ZDHC Wastewater Industry Implementation Approach etc.

5 ZDHC MRSL Chapters

5.1 Chapter 1: ZDHC MRSL

This applies to chemical formulations and substances used during the creation and wet processing of textile fibres, and during the creation and processing of (coated) fabrics, leather, rubber, foam and adhesives.

The MRSL substances are listed with applicable CAS numbers and provided with Applicability filters for substrates (Textile, Leather, Polymers -Rubber, Foam, Adhesives), Supplier Guidance, Formulation Limit and Methods of Analysis.

Supplier Guidance includes:

- No intentional use: these substances are banned from intentional use in facilities that process raw materials and manufacture finished products

- Not applicable: these substances are not applicable to the specific substrates

- No restriction: these substances are not restricted for the specific substrates

Formulation limits are concentration limits for the substances in commercial chemical formulations available from chemical manufacturers. These limits ban intentional use while allowing for reasonable expected manufacturing impurities, which should be consistently achievable by responsible chemical manufacturers.

Methods of Analysis describe general techniques of testing and wherever available, specific test methods.

In the ZDHC MRSL Table, R,F,A stands for Rubber, Foam and Adhesives.

ZDHC Manufacturing Restricted Substances List (ZDHC MRSL) V3.0 Nov 2022 (All rights reserved)

5.2 Chapter 2: ZDHC MRSL Candidate List

Substances proposed for addition to the ZDHC MRSL update, as described in the Principles and Procedures, as they lack safer alternatives at scale or more information on the same needs to be collected. Substances on the Candidate List encourages the innovation of alternatives.

5.3 Chapter 3: ZDHC Archived Substances

Substances without strong evidence of current use in Industry, but with clear evidence of historical use. The Archived Substances should not be reintroduced by a chemical manufacturer in their commercial chemical products. This list should be reviewed by ZDHC Approved MRSL Certifier through the chemical product's Safety Data Sheet or any other relevant document to confirm absence of these substances in the chemical formulation that is being certified for ZDHC MRSL Conformance.

6 Process for ZDHC MRSL Revision

The ZDHC MRSL is a living document and since its initial release in 2015 the ZDHC MRSL has been regularly updated. The update process is described here (https://downloads.roadmaptozero.com/input/ZDHC-MRSL-Principles-and-Procedures)

7 Transition Period

After the release of a new version of the ZDHC MRSL a transition period applies. This lets the Industry prepare for the implementation of the new version. The current transition period is twelve months, beginning on 01 November 2022. During this time, both versions of the ZDHC MRSL remain active and it's possible to certify against them.

https://downloads.roadmaptozero.com/input/ZDHC-MRSL-Industry-Standard-Implementation-Approach

1A. Alkylphenol (AP) and Alkylphenol Ethoxylates (APEOs): including all isomers

Potential Uses

APEOs can be used as or found in: detergents, scouring agents, spinning oils, wetting agents, softeners, emulsifier/dispersing agents for dyes and printing formulations, impregnating agents, de-gumming agents / auxiliaries for silk production, dyes and pigment preparations, polyester padding and down/feather fillings.

1D. Chlorobenzenes and Chlorotoluenes

Potential Uses

Chlorobenzenes and chlorotoluenes (chlorinated aromatic hydrocarbons) can be used as carriers in the dyeing process of polyester or wool/polyester fibres. They can also be used as solvents. Additionally, they can be found in colourants and specialty chemicals as an impurity. Substance CASNO Applicability Supplier Guidance Formulation Limit General Techniques for Analysing

1E. Chlorophenols

Potential Uses

Chlorophenols are polychlorinated compounds used as preservatives or pesticides. Pentachlorophenol (PCP) and tetrachlorophenol (TeCP) have been used in the past to prevent mould when storing/ transporting, raw hides and leather. They are now regulated and should not be used. 1G. Dyes – Carcinogenic or Equivalent Concern

Potential Uses

Most of these substances are regulated and should no longer be used for dyeing of textiles and leather. For some dyes, it is not possible to directly detect the dye and it must be done by indirect methods as explained in the DIN standard.

1H. Flame Retardants

Potential Uses

Flame retardant chemicals are deliberately applied to meet legal and contractual flammability standards.

The use of the flame retardants listed below, or any halogenated flame retardant, is not permitted (for fashion, sport or outdoor clothing and apparel and home textiles).

It should be noted that there may be certain critical (technical textile) end uses where legally or contractually mandated standards may only be achieved using these substances (e.g. military, medical, protective clothing, transportation). The formulations will always be deemed ZDHC MRSL NON-CONFORMANT and it is intended that the ZDHC Supplier Platform will appraise the end uses of any flame retardants within an inventory.

1I. Glycols / Glycol Ethers

Potential Uses

In apparel and footwear, glycol ethers / glycol esters have a wide range of uses including as solvents for finishing/cleaning, printing agents and dissolving and diluting fats, oils and adhesives (e.g. in degreasing or cleaning operations).

1J. Halogenated Solvents

Potential Uses

In apparel and footwear, halogenated solvents are used as finishing/ cleaning and printing agents, for dissolving/ diluting fats, oils and adhesives (e.g. in degreasing or cleaning operations).

Formulations containing any of the listed solvents above the published limits are NON CONFORMANT with the ZDHC MRSL. Despite the advancement of waterbased systems, there are a small number of solvent-based systems that remain the most prevalent in the industry and ZDHC recognises that it will take time to phase these out completely.

ZDHC guidance is to avoid the deliberate use of listed solvents wherever possible, with a transition to water-based formulations being preferable, and to ensure that worker exposure and emissions are minimised.

It is intended that the ZDHC Supplier Platform will assess the implementation of best practices for emission and exposure control as well as the usage of waterbased formulations at a facility.

Note: There are some solvent-based technologies that are generally regarded as having lower overall environmental impacts than aqueous alternatives (e.g. solvent scouring) and every specific scenario will be judged on its merits through the ZDHC Supplier Platform.

1L. Organotin Compounds

Potential Uses

Organotins are a class of chemicals combining tin and organics such as butyl and phenyl groups. Organotins are predominantly found in the environment as antifoulants in marine paints, but they can also be used as biocides (e.g. antibacterials), catalysts in plastic and glue production and heat stabilisers in plastics/rubber. In textiles and apparel, organotins are associated with plastics/rubber, inks, paints, metallic glitter, polyurethane products and heat transfer material.

Substance	CASNO	Applicability	Supplier Guidance	Formulation Limit	General Techniques for Analysing Chemicals
Dibutyltin (DBT) Multiple,	Textile	No intentional use	20 mg/kg	Solvent extraction,	
	including 683-18-1	Leather	No intentional use	20 mg/kg (*EXCEPTION - 100 mg/kg for Polyurethane based thickeners - See notes below)	GC MS, ISO TS 16179, ISO 22744-1
		Polymers (R,F,A)	No intentional use	20 mg/kg	

* In order to be able to optimise performance characteristics of some leather finishes, it is sometimes desirable to use PU thickeners and create formulations on-site rather than purchasing pre-mixed formulations from chemical suppliers. In these instances, there is a more lenient limit of DBT for the thickeners themselves, but the thickeners must not be used in quantities >20% in tailored formulations.

				Leather	No intentional u	se	Indigo 2000 mg Other dyes 500	, 0	Other - Non-reductive (ISO 14362 without reductive step)		luctive
				Polymers (R,F,A)	Not Applicable		Not Applicable		(See notes	below)	

Used in the manufacture of Indigo and some azo dyes. Residues from manufacturing can remain in the formulation. For all dyes other than indigo, it is important that non-reductive methods are used so that only the free aniline is analysed rather than that which could be formed by the cleavage of a dye molecule. For indigo, aniline can be tied up in insoluble clusters of dye and so a reductive method that fully solubilises the dye and liberates free aniline is used. The levels of aniline in indigo must be achieved by removal of the aniline and not by dilution, with a minimum indigo content of 30% being required.

		Polymers (R,F,A)	No intentional use of solid mixtures of TiO2 in powder form where >1% (w/w) of TiO2 particles have aerodynamic diameter ≤ 10 µm.	1% (w/w) of TiO2 particles have aerodynamic diameter ≤ 10 μm. (Liquid mixtures or emulsions or pastes containing TiO2, having proper GHS/CLP classification, are allowed for use.)	

1N. Perfluorinated and Polyfluorinated Chemicals (PFAS)

Potential uses

Formulations containing PFAS (Per and Polyfluorinated alkylated substances) are often used for water or stain repellency.

The use of any formulation based on, or including PFAS, including those listed below, is not permitted (for fashion, sport or outdoor clothing and apparel and home textiles).

It should be noted that there may be certain critical (technical textile) end uses where legally or contractually mandated standards may only be achieved using these substances (e.g. military, medical, protective clothing, transportation). The formulations will always be deemed ZDHC MRSL NON-CONFORMANT and it is intended that the ZDHC Supplier Platform will appraise the end uses of any PFAS within an inventory.

Note on PFAS and testing: There are thousands of individual chemicals that are categorised as PFAS but only a few are actually useful in terms of oil / water repellency and their use is always accompanied by the presence of common, known 'marker' chemicals such as those listed below. ZDHC approved MRSL certifiers will check for the deliberate use of PFAS or high levels of contamination of PFAS by testing for the marker chemicals listed below and ,at their discretion, use a screening test for total fluorine (quantification limit: 50mg/kg) followed by confirmatory testing for specific series e.g. the other PFAS mentioned in the PFAS ZDHC Guidance Sheet. ZDHC approved MRSL certifier reserves the right to request or carry out test for any specific PFAS chemical using appropriate test or the test method to check MRSL certifier reserves the right to request or carry out test for any specific PFAS chemical using conformance.

10. Phthalates – including all other esters of ortho-phthalic acid

Potential Uses

Esters of ortho-phthalic acid (phthalates) are a class of organic compounds commonly added to plastics to increase flexibility. They sometimes are used to facilitate moulding of plastic by decreasing its melting temperature. Phthalates can be found in:

- Flexible plastic components (e.g. PVC)

- Print pastes

- Adhesives - Plastic buttons

- Plastic sleevings

- Plastic sleevings - Polymeric coatings All esters	0	f ortho-	phthallic	acid	are	restricted	including	those	listed	below

1P. Polycyclic Aromatic Hydrocarbons (PAHs)

Potential Uses

Oil containing PAHs are added to rubber and plastics as a softener or extender and may be found in rubber, plastics, lacquers, and coatings. Within the footwear producing industry, PAHs are often found in the outsoles of footwear and in printing pastes for screen prints. PAHs can be present as impurities in carbon black dyestuffs.

1Q. Restricted Aromatic Amines (Cleavable from Azo-colourants)

Potential Uses

Azo dyes and pigments are colourants that incorporate one or several azo groups (-N=N-) bound with aromatic compounds. Thousands of azo dyes exist, but only those that degrade to form the listed cleavable amines are restricted. Azo dyes that release these amines are regulated and should no longer be used for dyeing of textiles or leather.

1R. Total Heavy Metals

The formulation limits for As, Cd, Hg, Pb, and Cr (VI) in the list below apply to all types of formulation. When a limit for pigments is specific and differs from the general limit, it is denoted by brackets. The formulation limits for Sb, Cr, Ba, Se, Sn, Ni, Cu, Co and Ag only apply to dye and/or pigment formulations. Any differences between limits for dyes and pigments are indicated in the formulation limit column. The limits for the heavy metals do not apply to colourants containing a listed metal as an inherent compositional part (e.g. metal-complex colourants, the double salts of certain cationic colourants or extenders like barium sulfate). Wet processors must be aware of the metal limits in the ZDHC wastewater guidelines as well as the brand RSL limits with regard to extractable metals from dyed materials when using any colourant that has listed metals as an inherent compositional part. Where RSL and/or wastewater issues are observed, wet processors should discuss this with supply chain partners.

Potential Uses

Although	typically	associated	with	leather	tanning,	chromiur	n VI	also	may	be	used	in	the	dyeing	of	wool	(after	chroming	process).

Chapter 2 - ZDHC MRSL Candidate List

2A. Bisphenols	5	
Substance	CASNO	Intent
Bisphenol AF Bisphenol F Bisphenol S	1478-61-1 620-92-8 80-09-1	Numerous bisphenols, including those listed, are under investigation; based on the information available and their legal status, they may be added to the main list of ZDHC MRSL version 4.0 in the future
2B. Ethoxylate	d Tallow Amin	e
Substance	CASNO	Intent
Polyethoxylated tall amine	ow 61791-26-2	More information is required on specific substances in this group of chemical to make a jugment on restriction
	iyde	
Potential Uses Formaldehyde can Substance	be used or CASNO	present in many types of formulations such as fixatives, resins and binders Intent
Formaldehyde can	be used or	
Formaldehyde can	be used or	

2D. Phenol	
Potential Uses Phenol is not deliberately used in	textiles or footwear but trace amounts of phenol can be found in many chemical formulations.
Substance CASNO	Intent
Phenol 108-95-2	ZDHC is looking for safe limits for phenol as a contaminant in textile chemical formulations.
2E. Potassium Permanganat	e
Potential Uses Potassium Permanganate is p	rimarily used for localised bleaching of denim using a spraying process.
Substance CASNO	Intent
Potassium 7722-64-7	Potassium permangante must never be used without appropriate engineering
permanganate	controls (such as water curtains and localised extraction) and workers must
	always use appropriate personal protective equipment. Suppliers are strongly
	encouraged to evaluate alternatives to manual spraying of potassium permanganate - such as lasers, robotised spraying or safer chemical
	alternatives
2F. Solvents	
Potential Uses	
There are many uses of solvents including c Many solvents are restricted in the main lis candidate list as these may	t of the ZDHC MRSL. It is strongly advised that suppliers actively seek safer alternatives to the solvents listed in the be placed on the main list in future versions of the ZDHC MRSL.
Substance CASNO	Intent
2-Methoxypropanol 1589-47-5	It is intended to introduce a limit for leather formulations in the ZDHC MRSL version 4.
	Version
Methanol 67-56-1	Methanol is a concern because of its toxicity and in ZDHC MRSL version 4.0 it
	is intended to introduce maximum allowable limits and encourage substitution by safer solvents, which in many cases will be ethanol. However,
	we are aware that human consumption of industrial ethanol can be a problem
	and there is a requirement in some jurisdictions for industrial ethanol to be
	deliberately 'tainted' with methanol to make it undrinkable. This will need to be considered as we draw up recommendations.
	ZDHC Manufacturing Restricted Substances List (ZDHC MRSL) Nov 2022 (All rights reserved) Chapter 2: ZDHC MRSL Candidate List

2G. Total H	lea	avy M	etals															
Potential Uses In addition	to	being	used	in	dyes	and	pigments,	metals	are	used	as	raw	material	for	trims	and	other	components.
Substance			CASN	10		Intent												

Multiple

Metals (Nondye /pigment)

Studies on usage patterns of metal containing chemicals and formulations and the potential effect of restrictions are will be monitored on an on-going basis and additions made to the main list as appropriate.

Chapter 3 - ZDHC MRSL Archived Substances

3A. Dyes - Ca	rcinc	ogenic or	Equ	ivalent Co	oncerr	า									
Potential Uses Most of thes	se si	ubstances	are	regulated	and	should	no	longer	be	used	for	the	dyein	g of	textiles.
Substance		CASNO		Supplier Gui	dance
